

# friendlyway doorsign server®

## The software for automatised management

The friendlyway doorsign server offers extensive functions for the automatised management of meeting and conference rooms, in a modern application field. The product was conceived and developed through the friendlyway project department, on the basis of long term experience in the „digital signage“ market.

The available Version 1.0 supplied with this system offers all basis for a comfortable and effective room planning. Intelligent assistants and interfaces enable an extensive flexibility for use in medium sized businesses. Through the use of standard technology, a most seamless, trouble free integration into the business' current IT network is warranted.

The friendlyway doorsign server is based on a individually centralised room data bank placed in the business, on which the system environment is already configured and equipped. It offers an interface between the current customers „usual“ network, with the digital advert on the door sign. The complete system is web-based administered, which means that the use, control, and management of the system is operable with the current web browser (optimised on Firefox and Internet Explorer 7) from every work place in the company.

Through the provided and integrated Microsoft® Exchange™ 2003 Live interface, a real-time connection is guaranteed on the existing Microsoft Exchange 2003 Server. Businesses, which have already reserved and administrated their rooms digitally over Microsoft Exchange through the use of the fw doorsign server, incur no additional expenditure at all with the room reservation. The information about the room reservation is automatised in real time and reproduced on the respective door sign with the required information.

For the Stand-Alone use without Microsoft Exchange, the friendlyway doorsign server offers all essential possibilities for the convenient administration and reservation of meeting rooms. Besides the user-controlled room reservation, the calling of customers and employees with the system in the basic configuration is also possible. There is no limit to the number of users.

Software information

friendlyway doorsign server

Administration ranks

The friendlyway doorsign server is based on a centrally positioned, web-based administration user-interface, over which all relevant configuration information can be entered with assistance.

Exchange Networks

The friendlyway doorsign server offers a smooth integration possibility in existing Microsoft Exchange networks.

Central room layout

For networks, which do not implement room reserving through Microsoft Exchange Server, the fw doorsign server offers a convenient web interface for the reservation of meeting rooms. Through this, available information of all registered meeting rooms is offered, over a central overview, in a convenient calendar summary. The reservation is implemented in only 3 mouse clicks.

Unlimited expandibility

Through the use of the „Door IP“ technology, it is possible to simply activate connected door signs by triggering the TCP/IP- the standard network protocol. Through additional client licences, the friendlyway doorsign server can provide and administrate an unlimited (exact 65.254) number on digital door signs.
